FORECASTS & SCENARIOS

The money model — steer it

Set the annual cost per stage, inflation, and university plan. Everything below recomputes instantly. Start from a preset, then fine-tune.

Modest / public | **Private (balanced)** | Premium + abroad

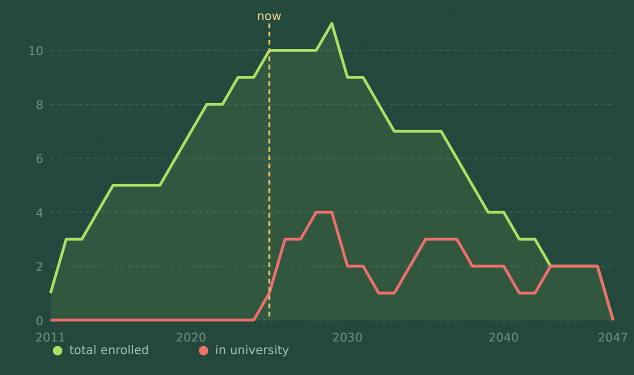
KG / year	QAR 25,000	Primary / year	QAR 35,000
Preparatory / year	QAR 42,000	Secondary / year	QAR 48,000
University / year	QAR 65,000	Inflation %/yr	4.0%
University length (yrs)	4	Abroad cost ×	×1.0

Currency

QAR

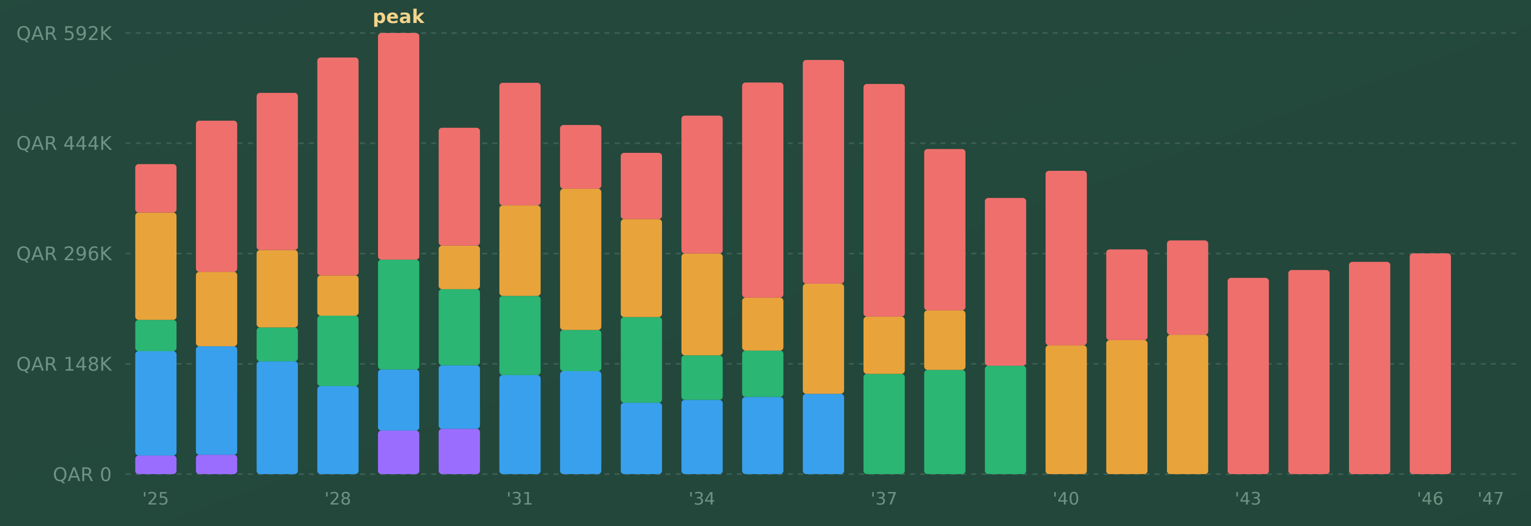
Enrolment load by year

How many children are in school vs university each year — your logistical & financial pressure curve.



Projected annual education spend

Stacked by stage, inflation-adjusted from the current year forward. Currency QAR · inflation 4.0%/yr · university 4 yrs



WHAT THE DATA IS TELLING YOU

Insights & takeaways

Generated live from your timeline and current cost assumptions — these update as you change the model above.

PEAK PRESSURE

2029/2030 is your costliest year

Projected QAR 591,948 — about 1.4× this year's spend, and 4 years away. Start ring-fencing for it now.

UNIVERSITY CRUNCH

Up to 4 in university at once

Around 2028/2029 several children overlap at university — the highest unit-cost stage. This is the window to have scholarships or savings locked in.

LOGISTICS

11 children enrolled simultaneously

Your busiest schooling year is 2029/2030. Plan transport, uniforms and fee deadlines around this load, not today's.

THE LONG HORIZON

A 22-year commitment

Total remaining education spend is ~QAR 9,475,465 — averaging QAR 36K/month if saved steadily. The last child finishes around 2047.

THE NUMBERS, YEAR BY YEAR

Forecast ledger

Projected spend and running total from now to the last graduation. Peak year highlighted in red, current year in gold.

Academic year	Enrolled	In uni	Annual spend	Cumulative

PLAYBOOK

Financial advice, lessons & decision-making tips

A practical playbook for funding a large family's education — tailored to a long horizon with overlapping university years.

🏦 **Build a dedicated education fund**
Separate education savings from everyday money. With a 20-year horizon, even modest monthly contributions compound dramatically — pay your future self first, automatically, on payday.

🛟 **Hold a fee-shock buffer**
Keep 6–12 months of total fees in liquid savings. It protects the children's continuity if income dips, so you never have to disrupt a school year under pressure.

⛰️ **Pre-fund your peak years**
Your costs aren't flat — they spike when several children hit secondary and university together. Treat each peak year as a sinking fund: divide its cost by the months remaining and save that amount now.

🔍 **Run a pre-mortem each year**
Imagine it's 2035 and the plan failed — why? Usually: underestimated inflation, no buffer, or overlapping universities. Naming the failure now lets you design against it.

📉 **Assume real inflation**
School fees historically outpace general inflation. Model 4–5%+ and revisit yearly. A plan that looks affordable at 0% inflation can be 60% larger over 15 years.

⚖️ **Weigh opportunity cost, not just price**
The real cost of a premium school is what that money could have become invested, plus the next child's needs. Compare options against your whole-family plan, not in isolation.

🎯 **Stagger big life costs**
Where you have a choice — cars, home upgrades, large trips — schedule them in the valleys of the enrolment curve, not the peaks. Look at the load chart before committing.

🤝 **Ask about sibling & multi-year discounts**
With many children, sibling discounts, annual-payment discounts and locked multi-year tuition can save real money. Negotiate as a long-term, multi-child family — you have leverage.

🎓 **Make scholarships a strategy, not a hope**
For the university crunch, start the merit/needs scholarship search 2–3 years early per child. One funded year at university can equal several years of school fees.

📅 **Review on a fixed cadence**
Money plans drift. Put one 'family CFO' hour on the calendar each year (e.g. before re-enrolment) to update costs here, check the buffer, and rebalance savings.

🧮 **Use the 10/10/10 rule for big choices**
For any major decision (private vs public, local vs abroad), ask: how will I feel about this in 10 minutes, 10 months, 10 years? It separates emotional spikes from long-term value.

🌍 **Decide the abroad question early**
Studying abroad can multiply university cost. Decide the default policy per child years ahead so you can save toward the real number — and adjust the 'Abroad ×' control to see the impact.
